My idea was to create a series of devices that maximizes the space allowance. This is why I tried to locate the longer path in the wasted area between source and detector.

This is only a draft and there will soon be a series, I created here the start and the end of the series. The series will consist of a snake path with varying amounts of bends, with exactly 10um space between horizontal lines so that distance was to be maximized.

I look forward to hearing your feedback.
